

## Spherical Roller Bearings

### 1. Types, design features, and characteristics

Spherical roller bearings consist of an outer ring having a continuous spherical raceway and two rows of barrel-shaped rollers guided by an inner ring with two raceways (see Fig. 1). This bearing has self-aligning properties, and therefore is suited for use where misalignment between the inner and outer rings occurs from housing installation error or shaft bending.

Spherical roller bearings have a large capacity for radial loads, axial loads in either direction, and combined loads. They are also suited for applications where vibration and shock loads are encountered. When spherical roller bearings are used with a vertical shaft or under a large axial load, the load on the rollers of the row that is not subject to the axial load becomes small, and the resulting skidding on the rollers may result in wear. If the ratio of the axial load to the radial load exceeds the factor  $e$  in the dimension table ( $F_a/F_r > e$ ), consult

**NTN** Engineering.

In addition to spherical roller bearings with cylindrical bores, spherical roller bearings with tapered bores are also available. Bearings with tapered bores are specified by the suffix "K" at the end of the spherical roller bearing part number. The standard taper ratio is 1:12 for bearings with a "K" suffix; for bearings in series 240 and 241, the suffix "K30" indicates the taper ratio for a bearing is 1:30. Most tapered bore bearings incorporate the use of adapters and withdrawal sleeves for shaft mounting.

$\begin{cases} \text{Light loads: dynamic equivalent radial load } \leq 0.05C_r \\ \text{Normal loads: } 0.05C_r < \text{dynamic equivalent radial load } \leq 0.10C_r \\ \text{Heavy loads: } 0.10C_r < \text{dynamic equivalent radial load} \end{cases}$

2) When the shaft diameter exceeds  $\phi 200$  mm and the bearing is to be used under heavy load or impact load conditions, please consult NTN Engineering.

3) The shaft shape error (roundness, cylindricity, etc.) must be within the tolerance range of IT5 and IT7.

Note: 1. All values and fits listed in the above tables are for solid steel shafts.

2. Use the formula below to calculate necessary interference. The upper limit value should not exceed 1/1 000 of the shaft diameter.

$\begin{cases} \text{When } F_r \leq 0.3C_{0r}, \text{necessary interference } \Delta d_F \text{ (μm) is } \Delta d_F = 0.08(d \cdot F_r/B)^{1/2} \\ \text{When } F_r > 0.3C_{0r}, \Delta d_F = 0.02(F_r/B) \end{cases}$

[d: bearing bore diameter (mm), B: inner ring width (mm),  $F_r$ : radial load, (N),  $C_{0r}$ : basic static rating load (N)]

When the difference between the bearing temperature and the ambient temperature during bearing operation is to be considered, consider the effective interference  $\Delta d_T$  (μm) by the temperature difference as the necessary interference.

$\Delta d_T = 0.0015 \cdot d \cdot \Delta T$

( $\Delta T$ : Difference between bearing temperature and ambient temperature °C)

Note: All values and fits listed in the above tables are for cast iron or steel housings.

### 3. Allowable speed of ULTAGE series

As the rotational speed of the bearing increases, the temperature of the bearing also increases because of the friction heat produced inside the bearing. Excessive heat will significantly deteriorate the bearing performance, causing abnormal temperature rises and seizure.

Factors affecting the allowable speed of bearings are as follows.

- (1) Bearing type
- (2) Bearing size
- (3) Lubrication (grease lubrication, circulating lubrication, oil lubrication, etc.)
- (4) Bearing internal clearance (bearing internal clearance during operation)
- (5) Bearing load
- (6) Shaft and housing accuracy

The allowable speed specified in the bearing dimension table is the limit for heat dissipation and satisfactory lubrication conditions before the bearing is adversely affected.

The allowable speed of ULTAGE series spherical roller bearings specified in the catalog is defined as follows.

#### [Oil lubrication]

The allowable speed for oil lubrication is the speed at which the outer ring temperature reaches 80 °C with room temperature spindle oil (lubrication oil viscosity: ISO VG32) supplied at 1 liter/min under an operating load of 5 % of the basic static load rating  $C_{0r}$ .

#### [Grease lubrication]

The allowable speed for grease lubrication is the speed at which the outer ring temperature reaches 80 °C with lithium-based grease (consistency: NLGI3) filled 20 to 30 % of the free space under an operating load of 5 % of the basic static load rating  $C_{0r}$ .

In either of the lubrication methods, the bearing temperature rise differs if the usage condition (operating load, rotational speed pattern, lubricating condition, etc.) is different; therefore, the bearings must be selected with sufficient allowable speed as specified in the catalog.

If 80 % of the allowable speed specified in the dimension table is exceeded or the bearing is used in vibration or impact conditions, please consult NTN Engineering.

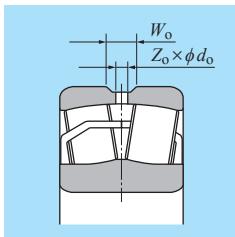

See section "9. Allowable speed" for the allowable speed of the spherical roller bearings that are not part of the ULTAGE series.

## 4. Oil inlet and groove for outer ring

Both ULTAGE series and type B spherical roller bearings are provided with oil inlets and an oil groove (see **Fig. 2** and **Table 4**).

Types 213 and C do not have oil inlets and grooves. However, they can be made based on customer request. Contact **NTN** Engineering with the bearing numbers and supplementary suffix code "D1" (refer to page A-48).

If a pin to prevent outer ring rotation is necessary, contact **NTN** Engineering.

**Fig. 2**

**Table 4** Oil inlet number

320	1 010	8	3	
1 010	—	12	—	

For oil groove width *W<sub>o</sub>* and diameter of oil inlet *d<sub>o</sub>*, see the dimension table.

## 5. Allowable misalignment angle

Spherical roller bearings have the same self-aligning properties as other self-aligning bearings. The allowable misalignment angle varies according to dimension series and load conditions, but the general allowable misalignment angles are listed below:

- Normal load or more: ..... 1/115
- Light load: ..... 1/30

\*Increasing the misalignment angle beyond the allowable angle may cause the rollers to protrude from the outer ring and interfere with nearby components.

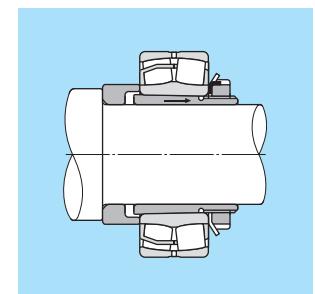

## 6. Adapters and withdrawal sleeves

Adapters are used for installation of bearings with tapered bores on cylindrical shafts (see **Fig. 3**). Withdrawal sleeves are also used to install and disassemble bearings with tapered bores onto and off of cylindrical shafts (see **Fig. 4**). In disassembling the bearing from the shaft, the nut is turned against the side face of the inner ring utilizing the bolt provided on the withdrawal sleeve, and then the sleeve is drawn away from the bearing's bore. (Precision and dimensions of adapter and withdrawal sleeve are defined in JIS B 1552 and JIS B 1556).

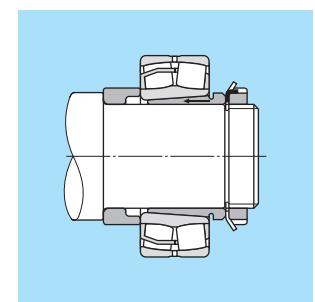

For bearings with a bore diameter of 200 mm or more, high pressure oil (hydraulic) type adapters and withdrawal sleeves can be made to make installation and disassembly easier. As shown in **Fig. 5** construction is designed to reduce friction by injecting high pressure oil between the surfaces of the adapter sleeve and bearing inner bore by means of a pressure fitting.

If the oil supply inlet is attached in the nut side of the adapter, the supplementary suffix "HF" is added to the bearing number; if the oil supply inlet is attached on the opposite side, the suffix "HB" is added to the bearing number. For adapter sleeves, the supplementary suffix "H" is added to the bearing's number for both cases. The hydraulic sleeve nut is equipped with holes for bolts used for mounting and dismounting and holes for hydraulic piping. The suffix SP (with screw holes) or SPB (with bolts) is added to the bearing number of the nut.

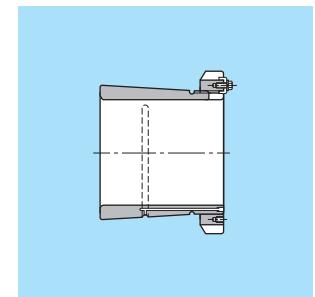

For information on the **hydraulic adapters** and **withdrawal sleeves**, see the special catalog "**Adapters, Withdrawal Sleeves, Locknuts, Lockwashers & Lockplates, Hydraulic Nuts (CAT. No. 4201/E)**."

1) Bearing numbers with \* are ULTAGE series and have outer ring oil inlets and oil grooves as standard. Bearing models having outside diameter *D* dimension of 440 mm or more are the type EM (large size). 2) Bearings appended with "K" have a tapered bore ratio of 1:12; bearings appended with "K30" have a tapered bore ratio of 1:30. 3) Smallest allowable dimension for chamfer dimension *r*.
